

UP³i: Why Should I Care?

Because UP³i enables you to make your production print line more profitable.

UP³i allows you to centrally control with high speed connectivity all of your printing and processing devices with one unified interface through a firewire connection regardless of the manufacturer of those devices.

IMPROVE PRODUCTIVITY

Confidently accelerate the production print process with UP³i. Since the production devices are integrated you can have a stable, continuous and dynamic workflow environment for reliable print. Set up from a single operating panel or graphical user interface allows preparation time for jobs to decrease, so you spend more time printing and less time setting up.

ENHANCE PROCESS CONTROL

UP³i delivers a single point of control over your production print system, so your equipment receives and sends messages to other UP³i enabled devices more efficiently. You can confidently print documents and optimize production with less human intervention and reduced errors. Produce processing mark-free documents through UP³i's ability to code documents with packets of information throughout the production print process.

PROTECT YOUR INVESTMENT

Since UP³i is based upon open non-proprietary standards you will be able to use most existing devices and integrate UP³i enabled devices into your network in the future. Further, as more companies join, you will be able to more easily expand and update your production equipment as your business grows and adapt it to a more profitable production print model.
